

FOUNDATION POLES

Simplestcabins small buildings are supported by eight foundation poles. Each pole must take on vertical load of 2400 kg (23,5kJ). Depending on the place of use the soil type and load capacity varies. Consult your local building specialist when laying the groundwork.

On top of the foundation poles two mountable base joists made of three deep impregnated timber details will be fixed. The foundation design solution must ensure that each base joist that is on top of foundation pole should have a minimum surface support of 200 cm².
